- Conclusions

Introduction

- SSMIS: Special Sensor Microwave Imager Sounder
- DMSP F-16 SSMIS was launched on 18 October 2003
 - (F-17 SSMIS was also launched on 4 November 2006)
- SSMIS data will be major source for NWP in transition time from POES to NPOESS.

Schedule of Polar orbiting satellite

SSMIS will be on
board these satellites

SSMIS may be important for NWP for the next decade.

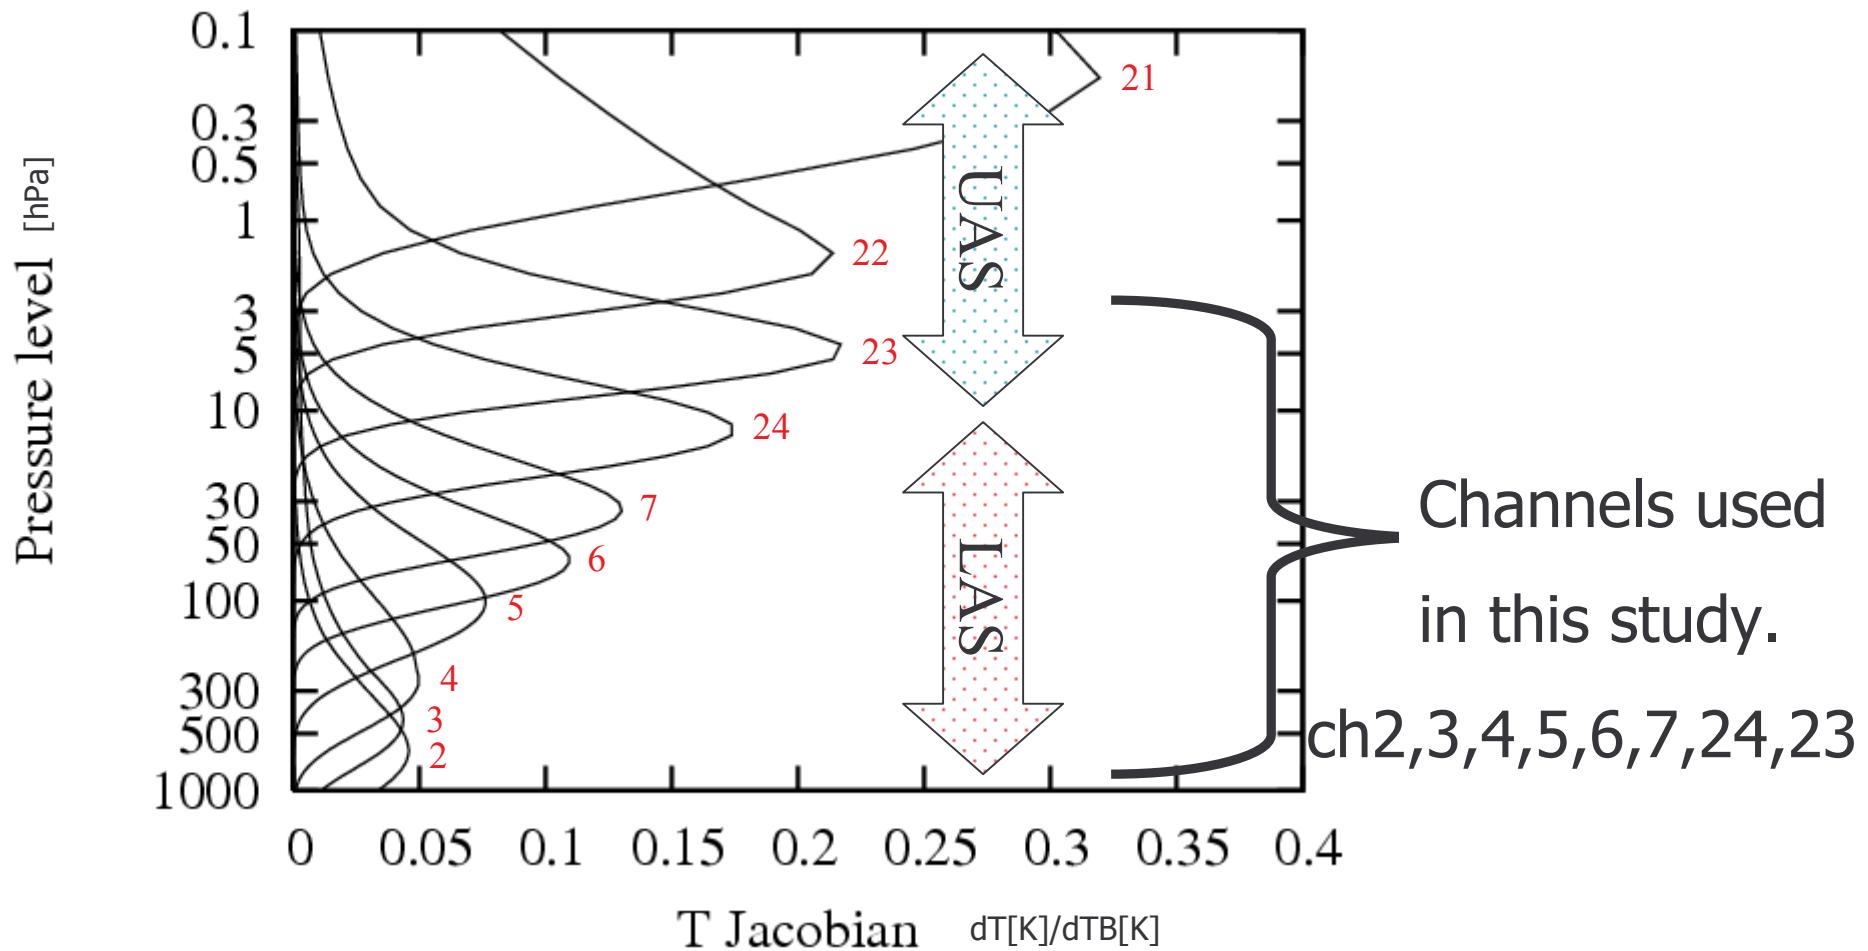

SSMIS

- Conical scanning instrument and successor of SSMI
- Four components of SSMIS instrument
 - Lower atmospheric temperature sounding channels (**LAS**)
 - (Freq. 50-60GHz, ch1-7,24)
 - Imager channels (**IMG**)
 - (Freq. 90-183GHz, ch8-11,17 and 18)
 - Environmental channels (**ENV**)
 - (Freq. 19-23GHz, ch12-16)
 - Upper atmospheric temperature sounding channels (**UAS**)
 - (Freq. 60-63GHz, ch19-23)

SSMIS has temperature sounding channels (LAS) along with window channels (ENV). ENV can be used for cloud detection.

But, as each component has different observation locations. Collocation (re-mapping) is necessary to use these components together.

SSMIS Temperature Jacobian for US Standard Atmosphere

SSMIS can bring atmospheric temperature information for NWP.

However...

- Since the launch, F-16 SSMIS has been suffering from calibration problems.
- The largest problems are solar contamination in the warm calibration target and an emissive antenna

Therefore,

- Pre-processed (re-calibrated) SSMIS radiance data are produced and distributed to several NWP centers by UKMO and NESDIS.

The purpose of this study is to investigate the quality of pre-processed (re-calibrated) SSMIS data and their impacts on analyses and forecasts in NCEP global data assimilation system.

Quality of SSMIS data

- F-16 SSMIS data available at NCEP (Mar. 2007)
 - **NRL calibrated data** (Original data, no collocation)
 - Distributed to Public via Internet (NOAA CLASS Server)
 - **UKMO preprocessed data** (collocated on LAS)
 - Distributed to several NWP centers (ECMWF, NCEP, the Italian Met Agency and the Danish Met Service) pre-operationaly.
 - UKMO assimilate the data in their operational system since Sep. 2006
 - **NESDIS recalibrated data** (collocated on LAS)
 - Under development and evaluation at NCEP.

Comparison of temperature sounding channels between SSMIS and AMSU-A

- SSMIS has conical scan
 - AMSU-A has cross track scan
 - Different FOV size, polarization
- } many difference

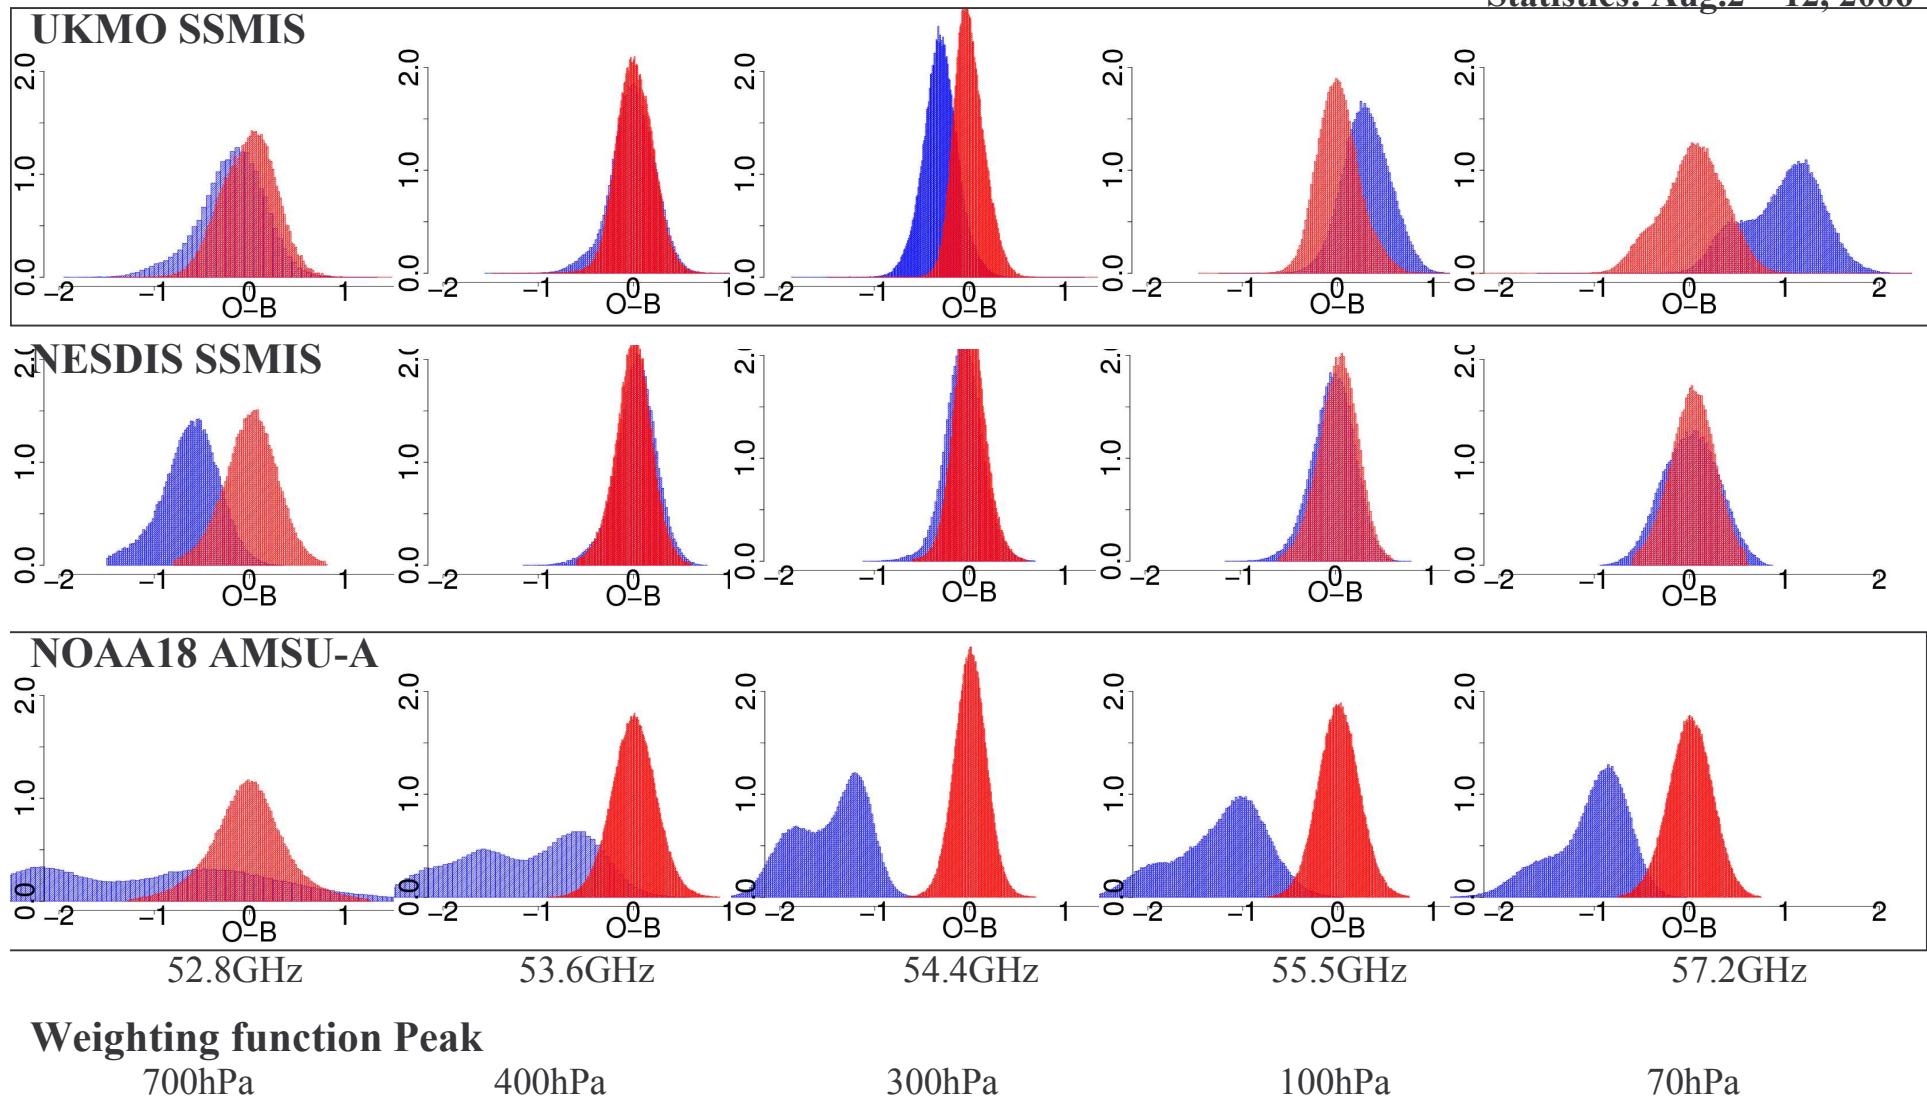

Frequency [GHz]	SSMIS channel number	Pol.	AMSU-A channel number	Pol.(at nadir)
52.800	2	V	4	V
53.596	3	V	5	H
54.400	4	V	6	H
55.500	5	V	8	H
57.290	6	RC	9	H
59.400	7	RC		
60.792668	24	RC		
60.792668	23	RC		

The comparison in the same frequency is just a rough estimate of SSMIS data quality

O-B histograms for QC passed data (global ocean data only)

Red: w BC
Blue: w/o BC

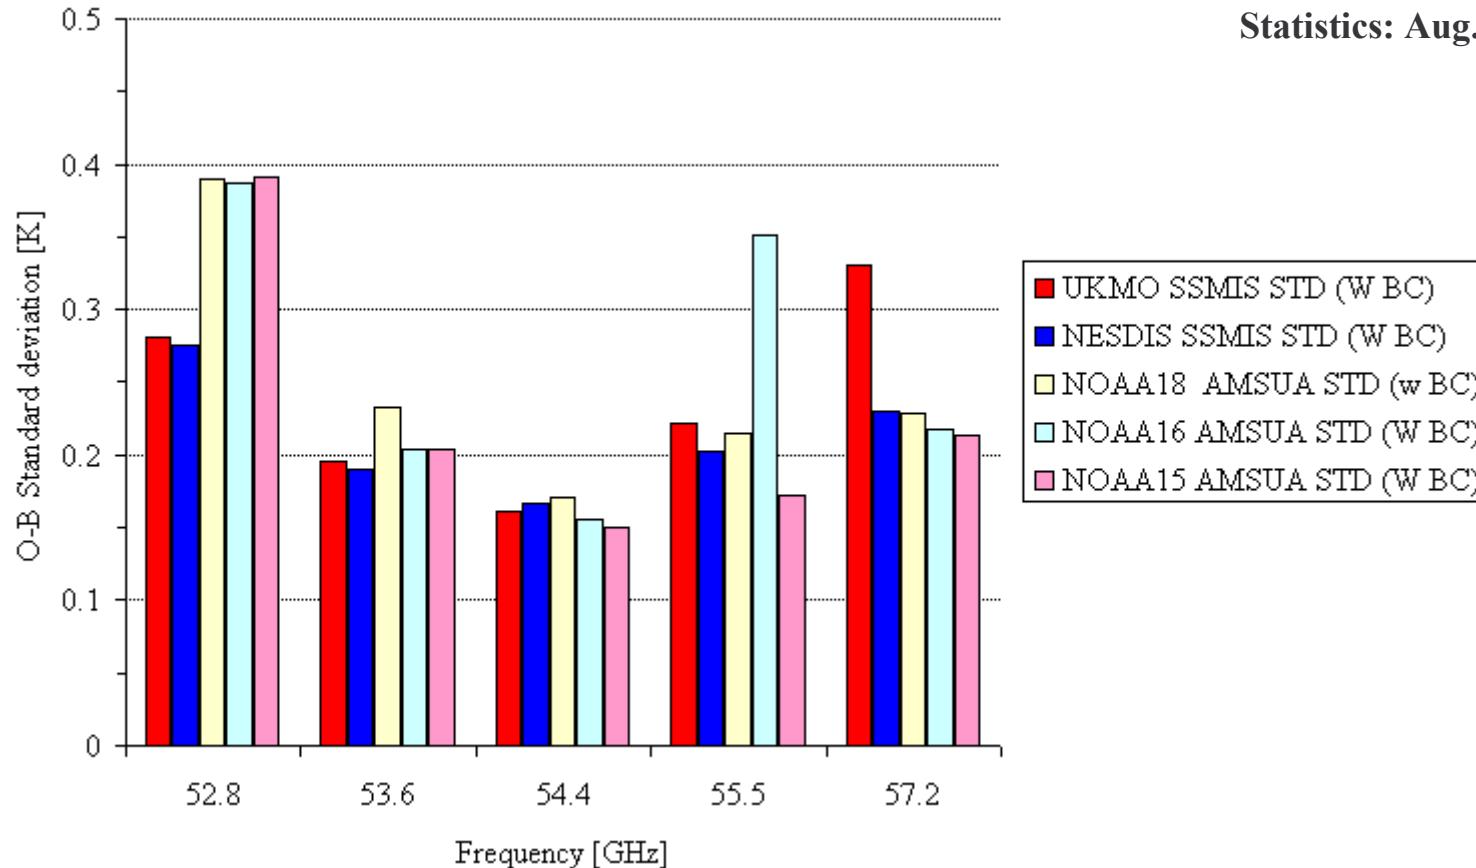

Statistics: Aug.2 – 12, 2006

Current AMSU-A bias correction scheme can be used for SSMIS.₁₀

Standard deviation of O-B for QC passed data (global, ocean only, with BC)

Statistics: Aug.2 – 12, 2006

For lower tropospheric channels(52.8GHz), quality of SSMIS data is better.
NOAA16 AMSU-A 55.5GHz (ch 8) has bigger std than others.
UKMO SSMIS STD 57.2GHz (stratosphere channel 6) has a big std.
Generally, preprocessed (recalibrated)SSMIS data are comparable with AMSU-A.

Assimilation experiments

- **Experiment with UKMO SSMIS data**
August 2 – October 7, 2006
(December 2, 2006 – February 10, 2007)
- **Experiment with NESDIS SSMIS data**
August 2 – October 7, 2006

Design of experiments

- Analysis: GSI 3D-Var (Sep. 2006).
- Forecast model: NCEP global forecast model (Dec. 2006).
- Resolution: T382L64.
- Added new data: SSMIS brightness temperature
(T sounding channels 2,3,4,5,6,7,23,24)
- Assimilation period: Aug. 2 – Oct. 7, 2006
- Forecast: every day 00Z initial, 168 hour forecast
- Experiment name
 - Prd: control
 - Pre: Test with UKMO SSMIS
 - Prg: Test with NESDIS SSMIS
- Both experiments use NCEP operational data set.
- Only Cloud-Clear data were used. 160km thinning.
- Operational radiance bias correction scheme was used.

QC of SSMIS data

- Selected channels (ch2,3,4,5,6,7,24,23)
- Thinning with 160 km distance
- Removal of flagged data (bad data and rain data) for UKMO SSMIS data
- Removal of cloud affected data by using a retrieval of cloud liquid water
- Gross error check

Usage

Ch2: ocean only, $\text{clw} < 0.2 \text{ kg/m}^2$

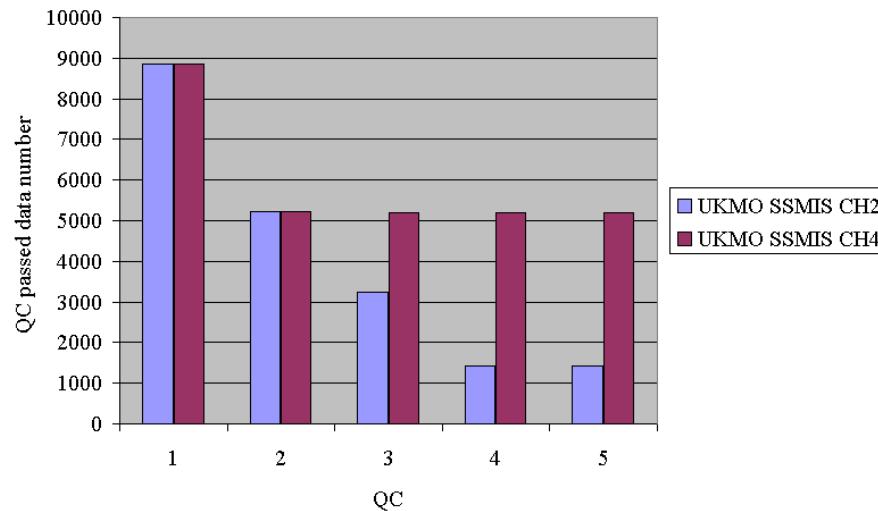

Ch3: ocean or land ($\text{alt.} < 2000\text{m}$), $\text{clw} < 0.6 \text{ kg/m}^2$

Ch4: ocean or land ($\text{alt.} < 4000\text{m}$), $\text{clw} < 0.6 \text{ kg/m}^2$

CH5,6,7,24,23: all qc passed data

UKMO

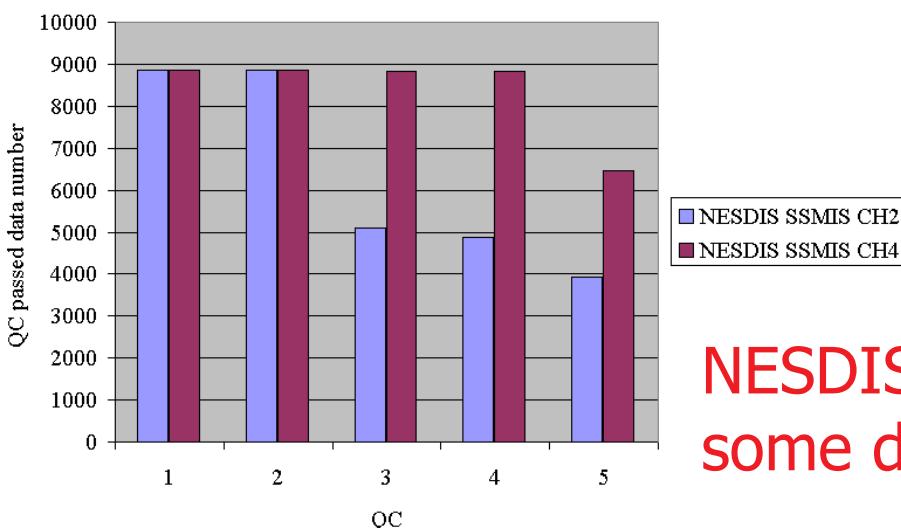

06UTC August 9, 2006

CH2: 15% data were used after QC
CH4: 60% data were used after QC

NESDIS

06UTC August 9, 2006

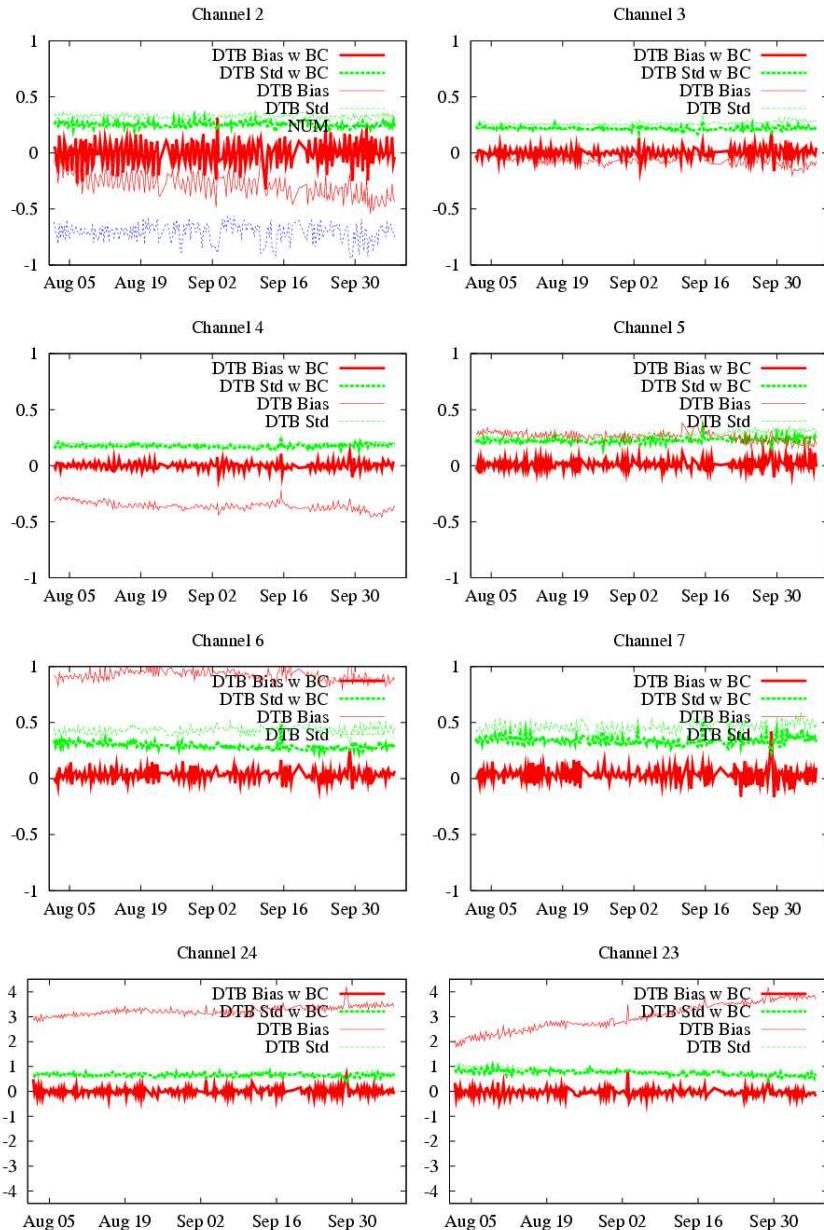

QC1: After thinning
QC2: Solar contamination and rain flag
QC3: land ice QC
QC4: Cloud QC
QC5: gloss error check

CH2: 44% data were used after QC
CH4: 72% data were used after QC

NESDIS correction algorithm can save some data from the solar contamination.

Bias correction

Time sequence of O-B (UKMO SSMIS)

- Same formula as other radiance data (AMSU-A)
- Scan dependent + air-mass dependent

5 predictors for linear regression of air-mass dependent part

Constant, Scan angle (=0 for SSMIS),
Cloud liquid water, Weighted laps late
($dt \cdot d\tau$), $(dt \cdot d\tau)^2$

Coefficients are optimized as analysis variables in GSI.

In general, SSMIS radiance bias correction works properly.

Assigned observation error

Ch2-7: 0.5K, Ch24, 23: 1.0K

Red: Bias

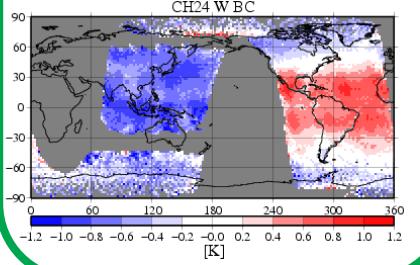

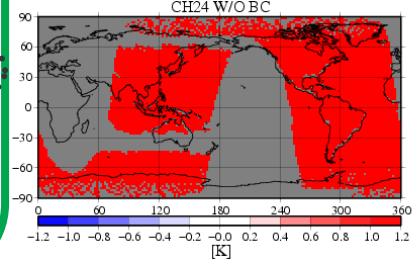

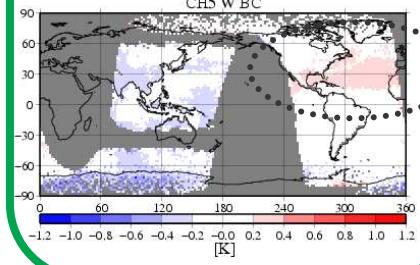

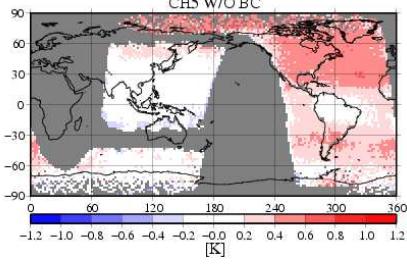

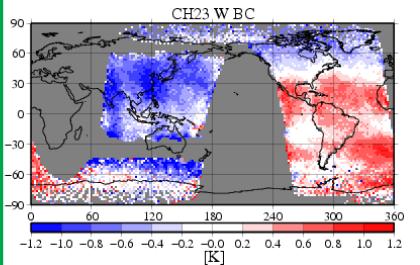

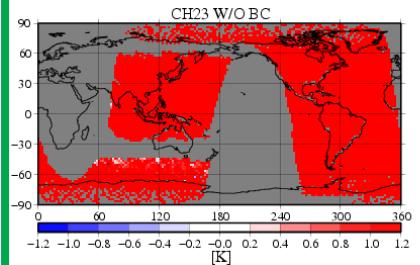

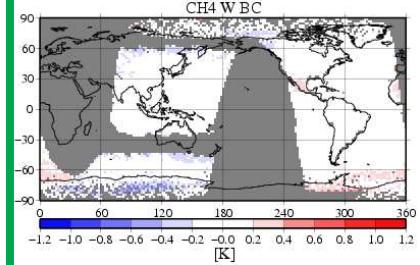

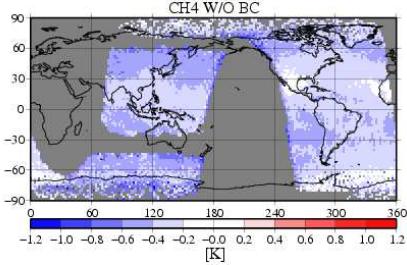

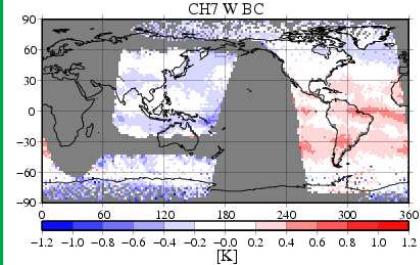

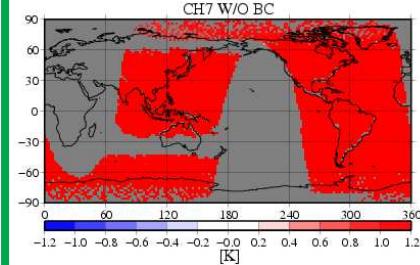

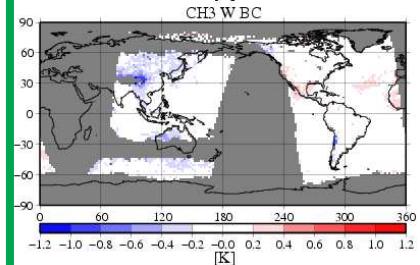

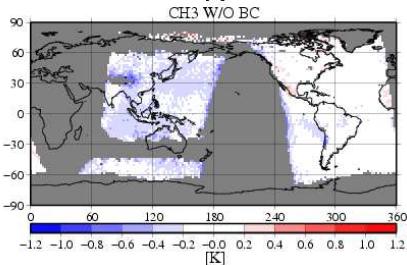

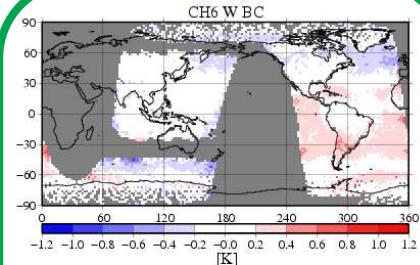

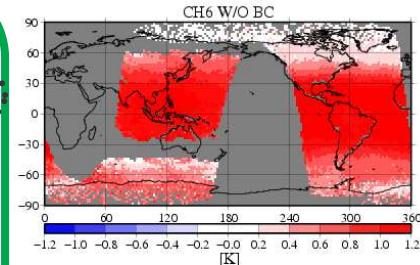

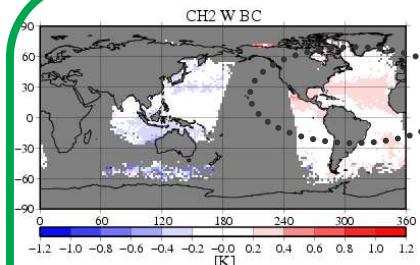

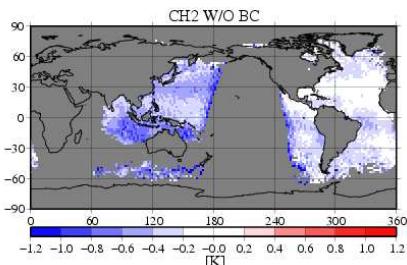

Green: Standard deviation

Mean O-B distribution for 00UTC analysis

UKMO
SSMIS

With BC

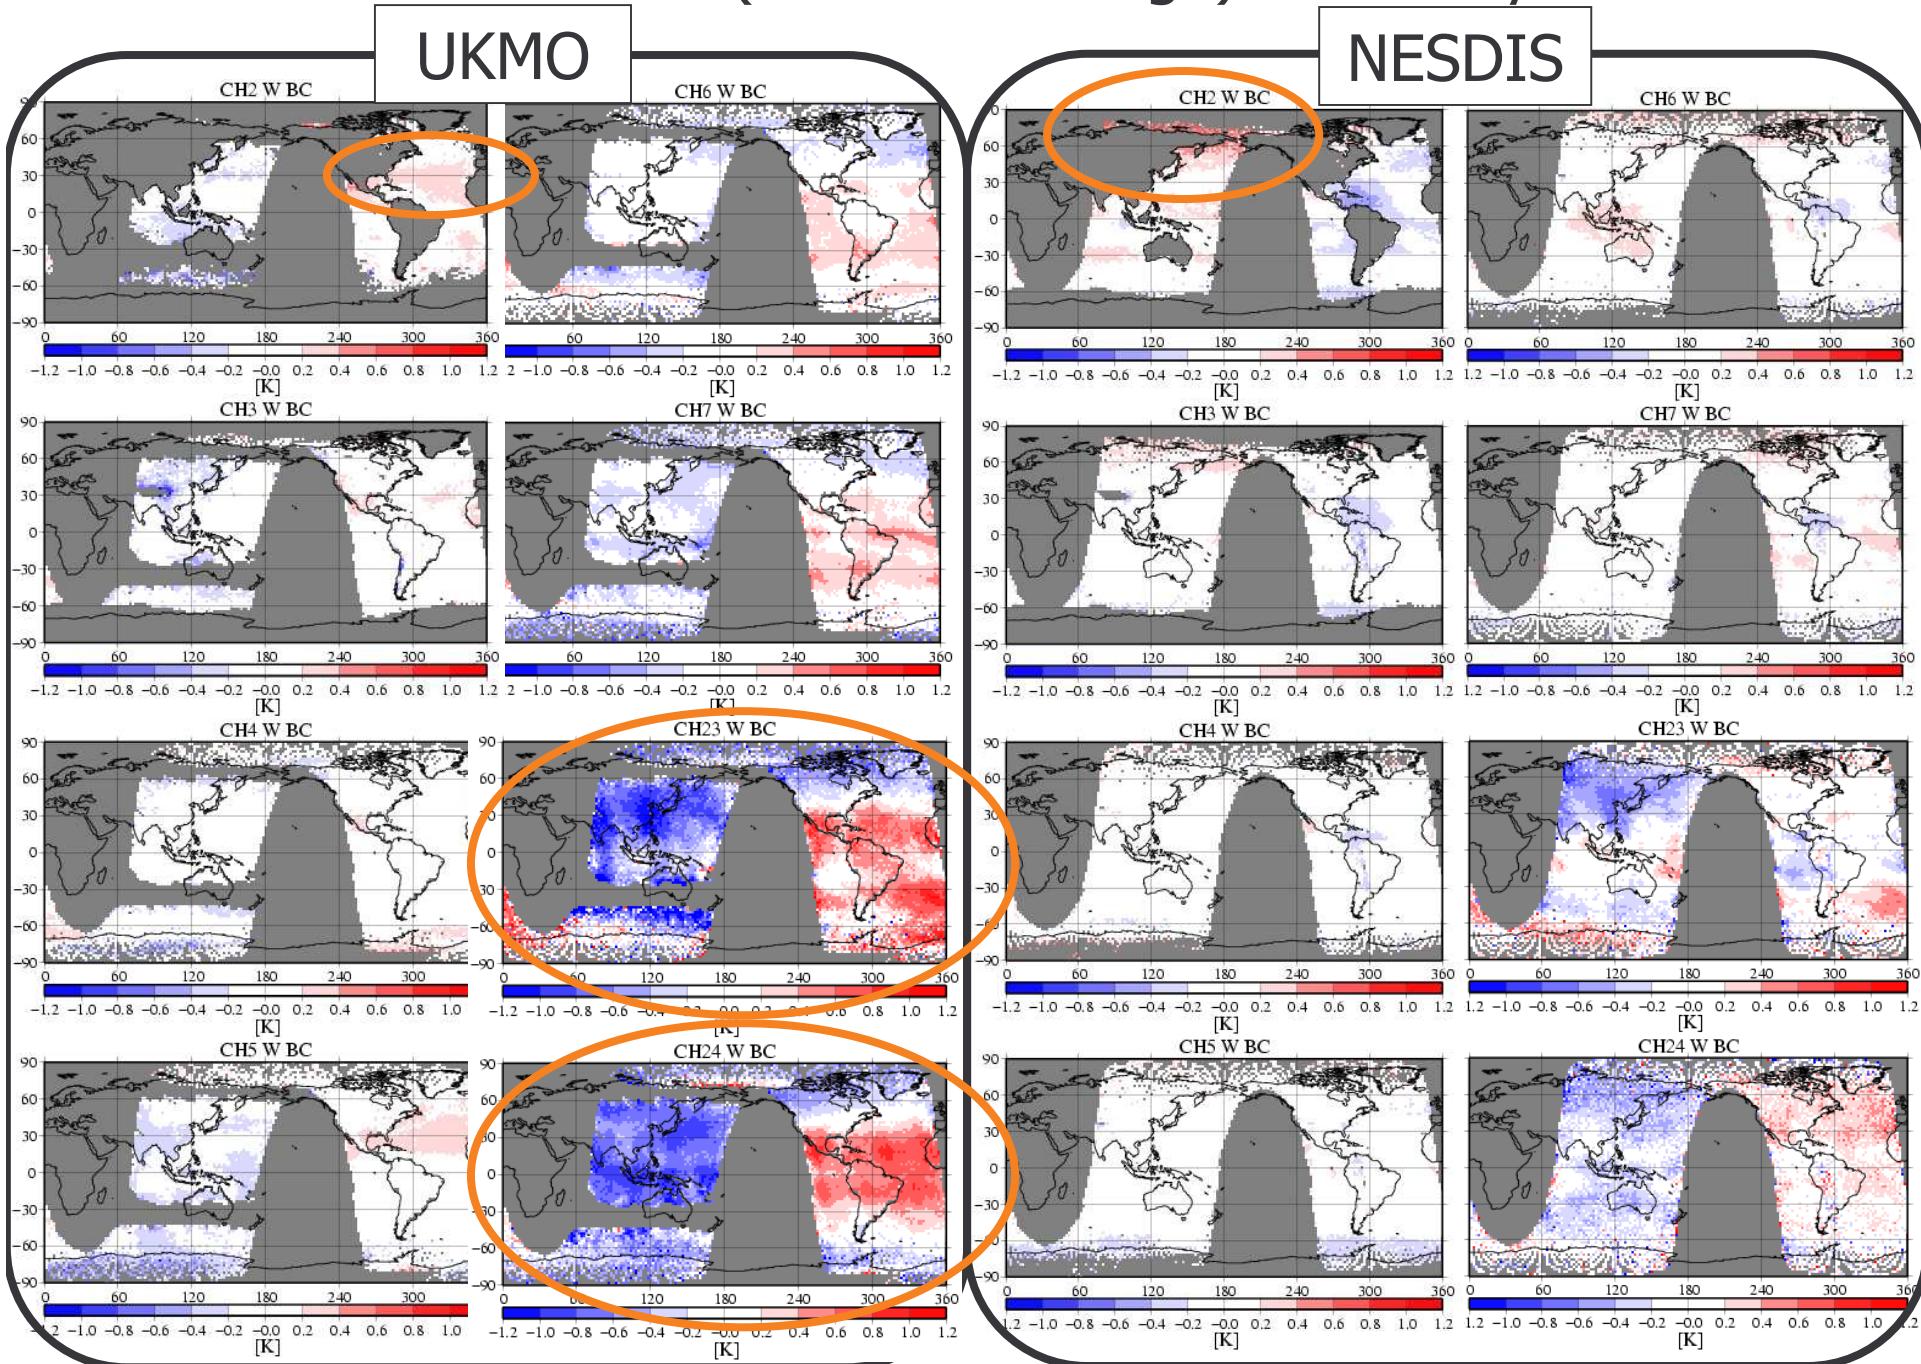

With BC

Ch2 and 5 have remaining bias around 30N in ascending orbit.

CH6,7,23 and 24 have unbalanced bias between ascending and descending.

..

Forecast of tropical cyclone and hurricane in the Atlantic Ocean

2 Tropical cyclone and 5 Hurricane from Aug. 1 to Oct. 2, 2006.

Hurricane & Tropical cyclone track forecast verification

About 50km improvement of position forecast at 96 hour forecast.

Conclusions

- Preprocessed UKMO SSMIS data and recalibrated NESDIS SSMIS data have comparable quality with AMSU-A data
- Assimilation experiments with cloud cleared SSMIS radiances (UKMO and NESDIS) in GSI were carried out.
- Impacts on analysis
 - Neutral in average fields. The data around 30N in ascending orbit make negative impacts on 500hPa height analysis increment. But it does not affect forecast accuracy so much. Negative above 10hPa due to unbalance bias in stratosphere channels. (UKMO SSMIS)
- Impacts on forecast
 - **Positive**: A.C. of Z500,Z1000(not shown), T200 A.C. for both hemisphere, RMSE of T,Z (1000-10hPa)
 - **Neutral**: Vector Wind(Trop. not shown), Fits to RAOB (most of element,1day,2day),TPW
 - **Negative**: Above 10hPa,T,Z (UKMO SSMIS)
- Precipitation (In 60-84hr forecast, slightly positive on North America)
- Small improvements for hurricane track prediction after 48hour forecasts (about 50km improvement in 96-hour forecast).
- **In NCEP GDAS, assimilation of preprocessed (recalibrated) SSMIS data can improve forecast accuracy especially in medium range forecasts.**

Final comments

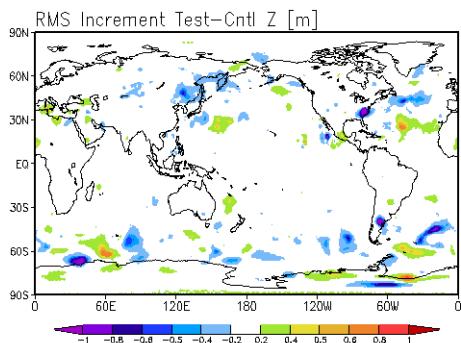

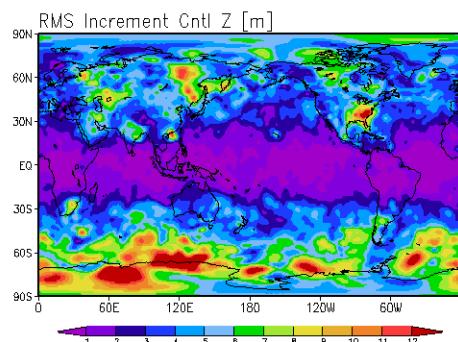

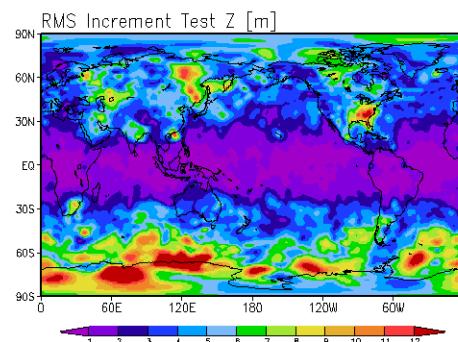

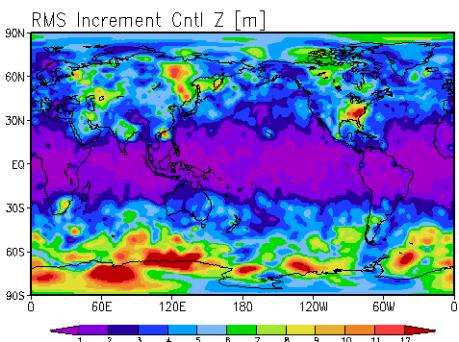

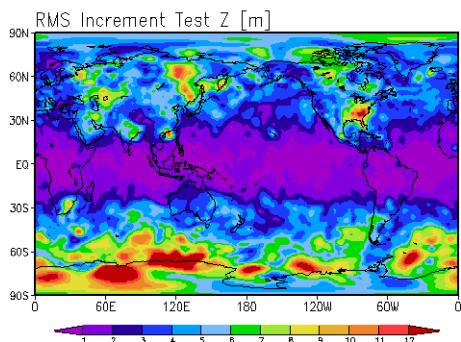

- Assimilations of corrected SSMIS radiances data show positive impacts on 500hPa height forecast score whichever SSMIS data is used (UKMO or NESDIS).
- In the stratosphere, much improvement was found from NESDIS SSMIS data.
- Correction algorithm (UKMO,NRL and NESDIS) should be merged and make an unified correction algorithm.
- Operational NWP center desire **one well-calibrated SSMIS data in real time base.**
- Clean SSMIS data (F17-F20) must be valuable for NWP in the next decade.
